

## Welcome

Thank you for sharing your ADS-B data with Plane Finder.

We know how much time and energy goes into creating a reliable ADS-B feed and very much appreciate the contributions of all who share with us.

To get the most from Plane Finder please use our Plane Finder client for Windows in place of any third party sharing software.

Using the Plane Finder client will ensure optimal data quality. You'll also get some pretty neat stats, maps, 3D aircraft views, 3D polar diagrams and more!

Please don't forget to ask us for free apps for your Apple and/or Android devices too.

With a Plane Finder share code you can also log into [planefinder.net](https://planefinder.net) for advert free access.

### Supported Receivers & Windows Versions

Our client will work with Windows version 8 or later. (Older operating systems no longer provide the level of security or functionality required by our client).

We support the following ADS-B receivers:

- Kinetic Avionics Puck, SBS3, SBS1 er and SBS1 - USB and Network
- Mode-S Beast - USB and Network
- DVB-T / RTL dongles - USB and Network (with RTL1090, Dump1090 or similar)
- AVR compatible receivers - USB/Serial and Network
- **Radarcape** - Please install our Linux client directly onto your Radarcape (Windows client not required)
- **Pi based systems** such as Flight Feeder - Please install our Linux client directly onto your Pi (Windows client not required)

### Installation Requirements:

Installation is very simple. You will need to know:

- The output port of your receiver software – BaseStation, PlanePlotter, RTL1090 etc.
- The IP address of your receiver if using a network option

We also recommend that you create a Plane Finder account for enhanced stats and advertising free access to [planefinder.net](https://planefinder.net). You can do this here:

<https://planefinder.net/sharing/>

Note: Please use your share code only once per receiver. For installations with more than one receiver simply run multiple client instances - each with their own unique share code.

## Ports & Data Quality

It is important to note that not all ports and software are created equal.

We also strongly recommend that you use RAW data as the input to Plane Finder wherever possible. BaseStation for example outputs RAW data on port 30006.

**We do not support 30003 data format as this is only a subset of the original ADS-B data.**

There are a lot of software tools out there too. Most of these do a great job but sometimes we see settings and options that manipulate or change data in unforeseen or unpredictable ways!

If you are seeing problems with the data in your receiver software please resolve this before sharing with Plane Finder. If in doubt please check our forum at <http://forum.planefinder.net> or contact us via [support@planefinder.net](mailto:support@planefinder.net)

## Installation & Configuration

To install the Windows client download and run the installation file from the Windows tab at: <https://planefinder.net/sharing/client>

Just follow the instructions to install the software. *Note - Windows Firewall may jump in and ask you to allow the installation.*

Once the software is installed: On a PC browser visit <http://127.0.0.1:30053> to configure the client (127.0.0.1 is the local host IP address of your PC).

You should see this:

---

To share your receiver data with Plane Finder you'll need to create a sharecode. If you already have a sharecode that you'd like to use, please [click here](#). If not, simply fill out the form below and we'll generate one for you!

**Email address**

**Receiver Lat**  **Receiver Lon**

[I already have a sharecode!](#)

Simply fill in the boxes.

*(Latitude and Longitude need to be in Digital Decimal format i.e. 48.858289, 2.294562).*

Once done select "Create a new sharecode". The code will also be emailed to you.

*Note – if re-visiting the configuration of an existing installation select "I already have a sharecode" and enter the sharecode that you received originally via email.*

The only step left is to tell our client about your receiver. In the instance below BaseStation is running on the same PC with a Kinetic SBS receiver.

Receiver data format

How are you connecting to your receiver?

IP address

Port number

Click "Complete configuration" when done

You should then see tabs in the browser for 2D & 3D Map Views, Data View, Log View, Polar View, Stats and Settings.

We think that these are pretty cool and hope that you agree.

Your New Plane Finder client icon should look like this. The app can be found in your taskbar and should run automatically.

Once done you should add your new sharecode to your account on <https://planefinder.net/sharing/>

## Stats & Receiver Performance

We've also included local and web tools to help you get the most from your receiver.

Here's a quick screenshot of a stats page: (127.0.0.1:30053)

Be sure to check out all of the tabs to get the most from our client.

You can see additional information and check that we are receiving data via your online sharing account at <https://planefinder.net/sharing/>

Don't forget to assign your receiver sharecode. Only then will you be able to view the private data page and gain unrestricted access to planefinder.net

## Feedback & Support

If the client is not working it is worth checking the ports entered and the Log View tab. We might ask you to send the logs to us to help with troubleshooting.

If you have any questions or feedback for us please use our forum at <http://forum.planefinder.net> or contact us via [support@planefinder.net](mailto:support@planefinder.net)

Don't forget to ask us for free apps if you can use them!

Thank you for sharing your data with Plane Finder.
